

NovaTac introduces the **Thorpe Technique™** developed by Daniel Thorpe, a Law Enforcement firearms instructor in Tucson, Arizona.

The Tactical Series of NovaTac flashlights was designed specifically for this simple, effective low light shooting technique.

Place the supplied O-ring in the groove of the NovaTac Tactical flashlight closest to the button.

The light is grasped between the index and middle finger of the support hand. Approximately 1/2" of the button end of the light protrudes toward the thumb. All four fingers of the light hand are used to support the weapon hand in a standard two hand grip.

Draw the button into contact with the ring finger of the strong hand to activate the light. The system allows excellent directional stability.
